WT-PST POWER SUPPLY TESTER (Advance Version)

How to use the PST (for desktop computer power supply units only)?

1. Plug in the 20/24 pin power supply into the PST unit as shown above. This is the MAIN POWER SUPPLY to the PST; and should REMAIN connected at all times for the other power supply cables to be tested.

   (Note: the main power supply is healthy if only all the LEDs show ALL GREEN "ON" Otherwise, it generates alarm which the power supply doesn't work properly).

   (WARNING: DO NOT PLUG-IN all power supply cables at the same time, this will short-circuit this unit)

2. Next, provided that the Main Power Supply to the PST is healthy, now can proceed to do some health testing for the other power cables.

2a) Health Power Check on SATA Power Supply Cable. To connect the SATA power cable the ==YELLOW== color should be facing toward left side of the PST box as shown below:

2b) Health Power Check on Floppy Power Supply Cable.

2c)   Health Power Check on Motherboard Power Supply Cable:

2d)   Health Power Check on Hard Drive/CDRom Drive Power Supply Cable:
