# PC Notebook Diagnostic Card

User's Guide

#### INTRODUCTION

Notebook Diagnostic Card is a powerful diagnostic tool for technicians and administrators to troubleshoot various problems of notebook PC PII/III/ P4 by using Mini PCI Bus. It is easy to install, yet extremely powerful to use. With this card in hand, you no longer have to go through tedious and time consuming process of trying to figure out what is wrong with your hardware. Notebook Diagnostic Card will indicate exactly what is wrong with your notebook in just seconds. It saves your time and money.

Our new and improved design of Diagnostic Card diagnostic card can work with almost all popular types of CPUs, Motherboards, and BIOSes..

## **System Requirements**

The Notebook Diagnostic Card itself only requires an empty mini PCI slot. It is not necessary to install memory chips to perform analysis. "POST Codes" can be displayed through the hexadecimal display panel.

# **Notebook Diagnostic Card INDICATORS**

'Indicators' are any light emitting diodes(LED) or hexadecimal display panel is mounted on extended cable. This section discusses the following indicators that appear on the Notebook Diagnostic Card:

- Notebook Mini PCI Bus Card
- Extend LEDs Post Code display

## **POST Code Display**

The POST Code Display is made up of a dual, dot matrix hexadecimal read-out that displays Power On Self Test (POST) status codes.

### **Power On Self-Test (POST) Codes**

This card can test the AMI/AWARD/PHOENIX BIOS, and it can be used in widely model of notebook. During system booting up, this card displays can show the post codes. Refer to Appendix A, it shows most POST codes provided by BIOS manufacturers. More diagnostic tools can be found in your motherboard manual, manufacturer web site and other online resources such as http://www.bioscentral.com.

# **PCI Signal Definition:**

**RST** Reset. After power on or reset, this indicator should be on for an half second

and then turned off.

**FRAME** PCI Bus Frame. Should be on under normal circumstances and flashes

when a PCI Frame Signal is detected.

TRDY Device Ready. Flashes when an TRDY signal is detected IRDY Device Ready. Flashes when an IRDY signal is detected.

VCC Motherboard Clock Signal. Should be on when power 5V is supplied to

the motherboard even without CPU.

# **INSTALLING Notebook Diagnostic Card**

#### **Installation Procedure**

TO INSTALL A Diagnostic Card:

- 1) Install the Notebook Diagnostic Card in mini PCI slot.
- 2) Connect the extendable display by flat cable
- 3) Power on the machine.

#### **POST Codes**

When the machine is turned on, the hexadecimal display should show the various POST codes (Post 80H + 84H) as the system executes (unless it has a rare BIOS that does not display POST codes).

If the machine does not boot, system POST has detected a fatal fault and stopped. The number showing in the hexadecimal display on the Notebook Diagnostic Card is the number of the test in which POST failed. Refer to Appendix A for a listing of POST codes.

## **Troubleshooting During POST**

After initial power up, Power-On Self-Test (POST) codes begin displaying on the Notebook Diagnostic Card's hexadecimal displays (for most machines).

NOTE: A few machines use the parallel port to display POST codes instead of the Diagnostic Card.

## **Jumper Setting**

This card is suitable for 3.3V/5V rating voltage. Normally, the original setting is 5V. Please check with your miniPCI slot rating voltage. If the voltage is 5V, please don't change the jumper to 3.3V. Otherwise, it will damage this card. For the 3.3V MiniPCI slot, please set the jumper to 3.3V, and recommend to remove the resistor on the board.

#### THE POST PROCESS

The ROM built onto the motherboard of the computer rums its built-in POST (Power-On Self-Test) when you switch power on to the computer, press the reset button on the computer, or press Ctrl-Alt-Del (warm boot). POST performs a tightly interwoven initialization and testing process for each of these methods, but it typically does not test or initialize memory above 64K for warm boot. You can get an even better idea of the detailed process by studying the POST code listings in Appendix A.

Error Code	Award (Edition: ELITEBIOS 4.51PG)
C0	Turn Off Chipset Cache
01	Processor Test 1
02	Processor Test 2
03	Initialize Chips
04	Test Memory Refresh Toggle
05	Blank video,Initialize keyboard
06	Reserved
07	Test CMOS Interface and Battery Status
BE	Chipset Default Initialization
C1	Memory Presence test
C5	Early Shadow
C6	Cache Presence test
08	Setup low memory
09	Early Cache Initialization
0A	Setup Interrupt Vector Table
0B	Test CMOS RAM Checksum
0C	Initialize Keyboard
0D	Initialize Video Interface
0E	Test Video Memory
0F	Test DMA Controller 0
10	Test DMA Controller 1
11	Test DMA Page Registers
12~13	Reserved
14	Test Timer Counter 2
15	Test 8259-1 Mask Bits
16	Test 8259-2 Mask Bits
17	Test Stuck 8259's interrupt bits
18	Test 8259 Interrupt Functionality
19	Test stuck NMI Bits Parity/IO check
1A	Display CPU Clock
1B-1E	Reserved
1F	Set EISA Mode
20	Enable Slot 0
21-2F	Enable Slots 1-15
30 31	Size Base and Extended Memory Test Base and Extended Memory
32	Test EISA Extended Memory
33-3B	Reserved
3C	Setup Enabled

2D	
3D	Initialize &Install Mouse
3E	Setup Cache Controller
3F	Reserved
BF	Chipset Initialization
40	Display virus protect disable or enable
41	Initialize Floppy Drive & Controller
42	Initialize Hard Drive &Controller
43	Detect & Initialize Serial/Parallel Ports
44 45	Reserved Detect & Initialize Math Coprocessor
46	Reserved
47	Reserved
48-4D	Reserved
4E	Manufacturing POST loop or display message
4F	Security Check
50	Write CMOS
51	Pre-boot Enable
52	Initialize Option ROMs
53	Initialize Time Value
60	Setup Virus Protect
61	Set Boot Speed
62	Setup Numlock
63	Boot Attempt
ВО	Spurious
B1	Unclaimed NMI
E1-EF	Bios Setup Page
FF	BOOT UP
F 6.1	AMEDIOG E 19: (071506)
Error Code D0	AMIBIOS Edition (071596) NMI is Disabled.CPU ID saved. Init code Checksum verification starting
D1	To do DMA init ,Keyboard controller BAT test ,start memory refresh and going
D3	to 4GB flat mode To start Memory sizing
D4	To comeback to real mode . Execute OEM patch. Set stack
D5	E000 ROM enabled. Init code is copied to segment 0 and control to be transferred to segment 0.
D6	Control point is in segment 0.To check <ctrl><home> key and verify main BIOS</home></ctrl>
D7	Checksum. If either <ctrl><home>is pressed or main BIOS checksum is bad Go to check point E0 else goto check point D7 To pass control point to Interface Module</home></ctrl>
D7	To pass control point to Interface Module.
D8	Main BIOS runtime code is to be decompressed.
D9	Control to be passed to main BIOS in shadow RAM

E0	On Board Floppy Controller (if any)is initialized. To start base 512K memory test
E1	To initialize interrupt vector table
E2	To initialize DMA and interrupt controllers
E6	To enable floppy and timer IRQ,enable internal cache
ED	Initialize floppy drive.
EE	Start looking for a diskette in drive A: and read 1st sector of the diskette
EF	Floppy read error
F0	Start searching 'MIBOOT.ROM' file in root directory
F1	'AMIBOOT.ROM' file not present in root directory.
F2	Start reading FAT table and analyze FAT to find the clusters occupied by
F3	'AMIBOOT.ROM' file Start reading 'MIBOOT.ROM' file cluster by cluster.
F4	AMIBOOT.ROM' file not of proper size
F5	Disable internal cache
FB	Detect Flash type present.
FC	Erase Flash
FD	Program Flash
FF	Flash program successful.BIOS is going to restart
	In F000 Memory Address for a real time code
03	NMI is Disabled . To check soft reset /power-on
05	BIOS stack set . Going to disable Cache if any.
06	POST code to be uncompressed.
07	CPU init and CPU data area init to be done.
08	CMOS checksum calculation to be done next.
0B	Any initialization before keyboard BAT to be done next
0C	KB controller I/B free. To issue the BAT command to keyboard controller.
0E	Any initialization after KB controller BAT to be done next.
0F	Key board command byte to be written.
10	Going to issue Pin-23,24 blocking/unblocking command.
11	Going to check pressing of <ins>,<end> key during power-on</end></ins>
12	To init CMOS if "Init CMOS in every boot" is set or <end> key is pressed.</end>
13	Going to disable DMA and Interrupt controllers Video display is disabled port-B is initialized. Chipset init about to begin
14	8254 timer test about to start
19	About to start memory refresh test
1A	Memory Refresh line is toggling .Going to check 15us ON/OFF time
23	To read 8042 input and disable Megakey Green PC feature .Make BIOS segment
24	able to write To do any setup before Int vector init

25	Interrupt vector initialization about to begin. To clear password if necessary
27	Any initialization before setting video mode to be done.
28	Going for monochrome mode and color mode setting.
2A 2B	Different BUSes init (system, static, output devices) to start if present. (please see appendix for details of defferent BUSes).  To give control for any setup required before optional video ROM check.
2C	To look for optional video ROM and give control.
2D	To give control to do any processing after video ROM returns control
2E	
2F	IF ega/vga not found then do display memory R/W test.
	Ega/vga not found .Display memory R/W test about to begin.
30	Display memory R/W test passed. About to look for the retrace checking.
31	Display memory R/W test or retrace checking failed. To do alternate Display memory R/W test.
32	Alternate Display memory R/W test passed. To look for the alternate display retrace checking
34	Video display checking over .Display mode to be set next.
37	Display mode set . Going to display the power on message.
38	Different BUSes init (input,IPL,general devices) to start if present.(please see Appendix for details of different BUSes)
39	Display different BUSes initialization error messages. (Please see appendix for
3A	details of different BUSes). New cursor position read and saved. To display the Hit <del> message.</del>
40	To prepare the descriptor tables
42	To enter in virtual mode for memory test.
43	To enable interrupts for diagnostics mode.
44	To initialize data to check memory wrap around at 0:0
45	Data initialized. Going to check for memory wrap around at 0:0 and finding the
46	total system memory size.  Memory wrap around test done. Memory size calculation over. About to go for
47	writing patterns to test memory Pattern to be tested written in extended memory. Going to write patterns in base
48	640K memory Pattern written in base memory .Going to findout amount of memory below 1M memory.
49	Amount of memory below 1M found and verified. Going to findout amount of
4B	memory above 1M memory Amount of memory above 1M found and verified. Check for soft reset and going to clear memory below 1M for soft reset.(if power on,go to check
4C	point#4Eh) Memory below 1M cleared. (SOFT RESET) Going to clear memory above 1M
4D	Memory above 1M cleared.(SOFT RESET)Going to save the memory size.(goto
4E	check point #52h). Memory size display started. (NOT SOFT RESET)About to display the first 64k
4F	memory size.  Memory size display started. This will be updated during memory test. Going for sequential and random memory test.
50	Memory testing /initialization below 1M complete. Going to adjust displayed
51	memory size for relocation/shadow.  Memory size display adjusted due to relocation/shadow. Memory test above 1M to follow.
52	Memory testing/initialization above 1M complete. Going to save memory size
53	information Memory size information is saved. CPU registers are saved. Going to enter in real mode

54	Shutdown successful, CPU in real mode. Going to disable gate A20 line and
	disable parity /NMI.
57	A20 address line ,parity/NMI disable successful. Going to adjust memory size depending on relocation/shadow.
58	Memory size adjusted for relocation/shadow. Going to clear Hit <del> message.</del>
59	Hit <del> message cleared. <wait> message displayed. About to start DMA and interrupt controller test</wait></del>
60	DMA page register test passed. To do DMA# 1 base register test
62	DMA# 1 base register test passed. To do DMA#2 base register test.
65	DMA#2 base register test passed. To program DMA unit 1 and 2
66	DMA unit 1 and 2 programming over. To initialize 8259 interrupt controller.
7F	Extended NMI sources enabling is in progress.
80	Keyboard test started . clearing output buffer, checking for stuck key ,to issue keyboard reset command. Bootup
81	Keyboard reset error/stuck key found. To issue keyboard controller interface test
82	command Keyboard controller interface test over. To write command byte and init circular buffer
83	Command byte written, Global data init done. To check for lock-key.
84	Lock-key checking over. To check for memory size mismatch with CMOS
85	Memory size check done. To display soft error and check for password or bypass setup.
86	Password checked. About to do programming before setup.
87	Programming before setup complete . To uncompress SETUP code and execute CMOS setup.
88	Returned from CMOS setup program and screen is cleared. About to do programming after setup
89	Programming after setup complete. Going to display power on screen message.
8B 8C	First screen message displayed. <wait> message displayed . PS/2 Mouse check and extended BIOS data area allocation to be done. Setup options programming after CMOS setup about to start .</wait>
8D	Going for hard disk controller reset.
8F	Hard disk controller reset done. Floppy setup to be done next.
91	Floppy setup complete . Hard disk setup to be done next.
95	Init of different BUSes optional ROMs from C800 to start.(please see Appendix-I
96	for details fo different BÛSes). Going to do any init before C800 optional ROM control
97	Any init before C800 optional ROM control is over. Optional ROM check and
98	control will be done next.  Optional ROM control is done. About to give control to do any required
99	Any initialization required after optional ROM test over. Going to setup timer data
9A	area and printer base address.  Return after setting timer and printer base address. Going to set the RS-232 base
9B	address Returned after RS-232 base address. Going to do any initialization before
9C	Coprocessor test Required initialized. Before Coprocessor is over. Going to initialize the
9D	coprocessor next. Coprocessor initialized. Going to do any initialization after Coprocessor test.
9E	Initialization after coprocessor test is complete. Going to check extd keyboard,
0E	keyboard ID and num-lock Keyboard ID command to be issued.
9F	110 yee mile 12 commune to et 155 act.

A3	Software error display complete. Going to set keyboard typemate rate.
A4	Keyboard typematic rate set . To program memory wait states.
A5	Going to enable parity/NMI
A7	NMI and parity enabled. Going to do any initialization required before giving control to optional ROM at E000.
A8	Initialization before E000 ROM control over. E000 ROM to get control next
A9	Returned form E000 ROM control. Going to do any initialization required after E000 optional ROM control
AA	Initialization after E000 optional ROM control is over. Going to display the system configuration.
AB	To build MP table if needed.
AC	To uncompress DMI data and execute DMI post init.
B0	System configuration is displayed
B1	Going to copy any code to specific area.
00	Copying of code to specific area done Going to give control to INT-19 boot loader Testing Point
2A	Different BUSes init (system, static, output devices) to start if present.
38	Different BUSes init(Input ,IPL,general devices) to start if present.
39	Display different BUSes initialization error messages.
